The design thinking process is an interesting topic that I would definitely utilize in the future and further projects as it makes it easier to think of problems with the chosen topic. This systematized way about how to determine what would be the requirements, things call pain points, and/or faulty features of already existing competition. The first step Empathizing being the most helpful as before I only designed based on what I wanted inside the application and never considered how the user would understand my UI or what they really needed within the application, having to empathize means I would further understand the problems that target users will be encountering as we try and put ourselves inside their shoes. Prototyping is another thing that I would love to adapt into my work process/ethic as I never went through prototyping my app ideas, 99% of the time I go straight into making a product and instead of having a prototype I do multiple versions which had cost me more time and effort to revise. Prototyping would help me be more efficient in making my projects as I would already have a rough draft to follow and I can get my products closer to being perfect as I can now support more revisions and they will be quicker to produce.
